

Dear Prof Tak,

I wish you a happy new year too and thank you for your compassionate email.

I am a global player who very much believe in peace in a world divided by egocentric driven philosophical mindset.

I am convinced that the mindset you preach and drive will bring positive change having served as Consultant for US Military Medcom, Europe, Middle-East and Africa Command, headquartered in Germany, I live and serve here now as CEO for Help-Point International Foundation, a non-governmental, cross-border, cross-culture, cross-religious platform that propels achievement of United Nations Millennium Development Goals in ways that will make unacceptable poverty, disease and unrest particularly in Africa , past history .

I wish to focus on two possible collaborative action plans with GUS.

1. Program to help youths and indeed the Government of Nigeria better manage unprecedented incidents of terrorism and destruction of life and property.

Evidenced based documentation show that this is driven by poverty in youths confronted by “Angst of no future perspective of life “

Politically neglected youths lack direction and assistance; cannot access knowledge necessary for self-empowerment and productive endeavors and so live wasted life in Africa. As you rightly mention in your email, *“in a global scale virtual super-computer, which is to be the step toward the creation of globally collaborative innovation network (Reference (a) above).*

We believe that the advent of broadband global Internet enables the realization of unleashing and energizing youngsters' creative minds around the world () collaboratively -- which subsequently leads to the attainment of global peace. This is to follow the precedence of Renaissance, which was created under two distinct cultures of Christianity and Islam.*

() There is abundant excellent brainpower in Africa, which is more valuable than gold, diamond, crude oil, etc. “*

2 My second plan is focused on universal access to Primary Care which I believe could be made possible by the use of low-cost , GUS-ICT enabled Intranet service that links up sub-urban and rural health care services to select medical centers which help facilitate adequate, appropriate and timely care. In this respect, I plan talks with Japan Embassy in Abuja, Nigeria as well as with the German International Development Agency “ GIZ” in Eschborn, Germany. .

I am convinced that your Global University System (GUS), which can power Distance Education Learning, Primary Care, Human Capacity Resource Skills Acquisition Training, etc can help bring about break-through in Africa and bring in enduring peace and universal self-sufficiency to resolve the lingering poverty and disease.

I will appreciate your support by recommending examples from GUS Communication best practices. For example, How to promote Primary Health Care access in sub-urban and rural areas using cost-contained Telemedicine Communication Service to enable universal access to appropriate and adequate care in Africa. Sony Corporation, Tokyo gave me their demonstration Tele-video Conferencing hardware kit during their Sony Professional Displays Technology Conference in Dubai 2009.

Japan government “ Maternal & Child Handbook of Japan ” dramatically reduced Maternal and Child death rate in Japan through revolutionary peer group education .

Through her humanitarian support services, the Japan Government deployed this handbook for use in Uganda.

Within the framework of GUS-ICT system. I will like to begin virtual model of the Japanese Maternal & Child Handbook, using inter-active communication graphic format designed for African women and their children.

Done in collaboration with JICA and empathic Japanese Health Care groups,. It will bring positive change to primary care in the African region .

I plan to also present this to United Nations Millennium Development Goals and UNDP-European Union Joint Migrant Initiative Program , Brussels which I assist voluntarily.

3. I am **already** working on “ Break-through” strategic plans to conquer one of the bane mitigating against acceptable development in Africa, the scourge of Malaria falciparium .

For all of these, I will greatly appreciate you helpful response.

Sincerely,

Prof. Edwin Scott Asemota, MD, DTMPH
