Dr. Paul Baran invented the Packet-Switching Technology, which is the very fundamental of the current Internet.

This pioneering effort enhances mutual understanding and trust among people of different countries and cultures, and facilitates world peace and sustainable development of humankind in the 21st century.

The essential principle of the packet-switching technology is “sharing,” i.e., the sharing of valuable telecommunication media, which brought drastic cost reduction of the telecommunication. This principle is now being extended to the sharing of information, knowledge through the World Wide Web, and even the sharing of wisdom through emerging e-learning and e-healthcare. This will create an egalitarian global society by global citizens for global peace.
